BioProject: PRJNA239895

The RNA-seq data used in this re-analysis were obtained from the NCBI Sequence Read Archive (SRA) associated with BioProject PRJNA239895.

Condition	Replicate	SRA Run
Control	R1	SRR1193981
Control	R2	SRR1193913
Infected	R1	SRR1193959
Infected	R2	SRR1193865

Experimental Conditions

Control

The mice were not infected with *Staphylococcus aureus*. Their gene expression represents the normal or baseline condition.

Infected

The mice were infected with *Staphylococcus aureus*, causing skin and soft tissue infection. Their gene expression was measured to identify changes in response to the infection.

Original Study Design

The study compared two groups of mice: a control group that was not infected and an infected group exposed to **Staphylococcus aureus**. Samples were collected from the mice at 1, 4, and 7 days after infection. The researchers used RNA sequencing to examine changes in gene expression and determine how the mice responded to the infection over time.
